## Comments on Varieties

Gladiolus fanciers have been impressed with the many fine varieties in all colors that are introduced at the flower shows each year. Improvements are gradually appearing in better facing and finer color.

**BALLAD**—(Large Decorative) (Midseason) Light rose shading to light yellow throat with a sort of translucent appearance. Opens 5-7 large wide open exquisitely ruffled blooms with about 18 total buds. Tall slender plant. One of the most beautiful pinks.

**BOLERO**—(Large-Dec.) (Midseason) Smoky orange with dark red blotch. Very odd and distinctive color. Opens 7 to 8 blooms which are ruffled, fluted, needlepoint, and have very heavy texture. Very attractive in arrangements.

**BURMA**—(Large Formal) (Mid-season) Deep rose shading somewhat brighter in the throat. Opens 7-10 heavily ruffled, beautifully placed, blooms on a straight spike 4 to 5 ft. tall most of the buds showing color. A wonderful variety for exhibition which has won many prizes in the past 3 seasons. Won several awards at Wisconsin 1944 including most beautiful spike in show. The Madison Chapter of the Wisconsin Glad. Society in 1945 awarded Burma a first in its color class.

**CHAMOUNY**—(Med.-Dec.) (Mid Season) A distinct shade of cerise rose with a silver line on the edge of all petals. Opens 10-12 blooms on a long head. Not a large flower, but one of the most beautiful and finest pinks.

**ETHEL CAVE COLE**—One of the finest new light pinks. Large round bloom with many open. Tall plants with long straight flower spike. Was champion spike of the show of the Madison Chapter of the WGS in 1945.

**FAIR ANGEL**—(Giant Formal) (Early Mid-season) Cream white shading deeper cream in the throat. Opens up to 8 large, round somewhat wavy 6 inch blooms with several more showing color 4-4½ feet tall. A beautiful variety that can beat any cream white variety in exhibition. It is also a first class cut flower variety as it opens well in water.

**LANCASTER**—(Large Exhibition) (Mid-season) Clear dark purple with no markings. Opens 8-10 lightly waved ruffled blooms on a tall straight spike with a plant often reaching 5 feet or more in height. Probably the best exhibition purple grown.

**LANTANA**—(Large Dec.) (Early) Orange shading through an orange salmon to a golden throat. A new and very beautiful bright vivid color. Opens 7-9 large well placed blooms on a medium height plant, less than 4 feet tall.

**LAVENDER and GOLD**—(Medium Decorative) (Very early) Fresh clean very light lavender blending to clear yellow throat. Opens 5 four inch blooms on a tall slender stem. Blooms are gracefully arranged with plenty of space between them. A beautiful variety for those who like pastel color in dainty size.

**LEONA**—(Decorative) Late, rose red medium dark popular with florists.

**PALERMO**—(Large Dec.) (Late Mid-season) Very large fiery orange with a somewhat darker blotch lightly ruffled. Opens 5 or more on a very long flower head and the plant grows 5 feet and up. Strong husky grower with heavy foliage and a good propagator. Burns some in the sun, but if cut in the bud is fine. Different from other oranges.

**RANGOON**—Most beautiful purple—ruffled and color of King Lear, heavy texture.

**ROCKET**—(Large Formal) (Mid-season) Most vivid gorgeous scarlet. Opens 7-8 medium large perfectly placed

blooms. One of the very finest reds but sometimes a little on the short side. Nice in arrangements.

**SPOTLIGHT**—(Lins) (Large Dec.) (Mid-season) Clear medium red of good texture. Lightly ruffled blooms are flat and wide open and well placed. Looks like a coming commercial red. Very good.

**CULTURE:** Bulbs we ship to you we will guarantee to be absolutely free of thrips. Nevertheless, we always dip our bulbs before planting and suggest it to our customers because this really should be absolute protection. The two most popular dips are the Bichloride of Mercury (Corrosive Sublimate) and the Lysol dip. Using the Bichloride of Mercury dip we soak them from 8 to 10 hours in a solution of one ounce to seven gallons of warm water, (preferable to keep the solution in a fairly warm place early in the season.) This quantity solution will cover, 1 bu. bulbs in thin cloth bags, each having its wood label. Use only wooden, glass or crockery containers as a chemical action, weakening the solution, will take place in a metal vessel. You can do no harm to the bulbs with this treatment except to delay blooming about ten days. The Lysol dip is widely used also: 1 tablespoon of Lysol to 1 gallon of water, soaking the bulbs four to eight hours. This is supposed to be a highly recommended control for any diseases on bulbs. With either treatment we feel it advisable to dip just preceding planting. Drained bulbs are planted wet.

The growing plants require dusting or else a spray with insecticide. Rotenone dust is not poisonous to persons, as children. The Tartar Emetic is effective on thrip used as a spray but exceedingly poisonous to people so care is necessary in its use.

**SPRAY FORMULA:** 1 oz. Tartar Emetic, 3 oz. corn syrup to three gallons water. Mix the dry poison and syrup first, then add warm water until syrup mix flows freely. Control measures should begin early, when the plant has 4 leaves and spike formation can be felt becoming round in the sheath of leaves. Dust twice a week and following every rain until spike emerges and shows color. Visible signs of thrip are silvery streaks on leaves, the buds are brown, the highly colored flowers have pigment removed and floret is deformed. On a bad infestation the buds do not open.

Bulbs should be planted away from buildings, trees or shrubs. A vegetable garden is fine, for gladiolus can be easily cultivated, have moisture, moderate amount of fertility and plenty of sunshine. Plant bulbs 6 inches apart; the large bulbs 4-5 inches deep—smaller ones less to 3 inches, bulblets only 1 in. in flat trench. Bulblets of most varieties do not bloom in Wisconsin the first year, but will give much delight to the home gardener by producing many young, thrifty bulbs from a small space. To produce more bulblets the plant needs 4 leaves left on when spike is cut. To do this slide knife down along second leaf from top, cut on slant half way through stem, then cut from opposite side to remove spike. Plants grow 5 to 6 weeks after flowers are cut to mature the bulbs and produce bulblets. The leaves are still green color when bulbs should be dug, top cut close to bulbs, which are placed in shallow trays for quick drying. If left in ground too long dry rot and scab diseases attack bulbs. Sunshine drying and free circulation of air for 2 weeks make fast curing. In one month the bulbs have cured so the old bulbs may be removed easily. Outer husk should be left on to protect bulb from bruise and excessive drying. A dry, cool storage of 40° to 45° Fahrenheit in a vegetable cellar is good. Open flat tray not more than the depth of 2 bulbs gives circulation of air. Dust lightly with Rotenone Dust and leave until planting time.
